

Great! I see the dataset. I'll proceed with the analysis and generate the requested memo.

Plan:

1. Load the data, inspect structure, and preprocess as needed.
2. Compute the overall mean efficiency with and without punishment.
3. Analyze paired configurations for within-pair treatment effects.
4. Assess heterogeneity of treatment effects across key features.
5. Fit two predictive models (linear regression & random forest) for treatment effects.
6. Extract and summarize practical heuristics and quantitative guidance.
7. Prepare Markdown memo with tables and results.

Let's begin by loading the data and inspecting its structure.
